ShopSmart API screenshots

Student: Paul Richard Calma
Capture date: 12 November 2026 (Asia/Manila)

These screenshots show **real local API calls** captured during the latest successful smoke run. A plain evidence viewer displays the method, URL, status code, submitted JSON and unmodified response JSON. This is not a Postman/DevTools screenshot or a mocked response. The raw records are in api-responses.json.

The checkout uses Alexandra Eala as a demonstration name with an invented email and address. No real contact information or credentials are included. The successful order is #3 for PHP 650; prior order #2 was retained.

API call	Observed status	Screenshot
GET /api/health	200	View
GET /api/products	200	View
GET /api/products?search=keyboard	200	View
GET /api/products/7	200	View
GET /api/products/invalid	400	View
POST /api/orders	422	View
POST /api/orders	409	View
POST /api/orders	201	View
POST /api/assistant/questions	200	View
POST /api/assistant/questions	200	View
POST /api/assistant/questions	422	View
POST /api/assistant/questions (isolated fallback API on port 3001)	200	View
GET /api/products/2147483647	404	View

All calls ran locally. The provider-fallback API had an empty provider key in its process environment; no key on disk was edited. Successful order creation was captured from the single browser checkout, not repeated to obtain a second screenshot.
