ShopSmart 1.0.0-quality-rc1 - release notes

Author: Paul Richard Calma (individual work)
Date: 12 November 2026, Asia/Manila
Version identity: submission archive **ShopSmart-Calma-Quality-RC1-Mermaid.zip**, updated project working tree based on Git commit **ba45bbf**. Changes have not been committed or pushed automatically. Submit the complete updated source with these records; do not submit only that base commit.

Verified working features

- Catalog browse, keyboard search, honest empty search state, product details, category and sort controls (category/sort inventoried; not separately exercised in the recorded browser smoke).
- Cart add, quantity increase/decrease, remove, correct PHP 650 / PHP 1,300 totals and intentional reset on browser refresh.
- Simulated checkout using demo name Alexandra Eala and fictional contact details: latest run returned HTTP 201, order #3, PHP 650.00, cleared cart; Wireless Mouse stock 11 -> 10. Earlier demo order #2 was preserved. Invalid checkout returned 422; out-of-stock keyboard returned 409 and had a disabled purchase button.
- Gemini-assisted selection was observed in an earlier run (**mode: ai**). The refreshed screenshot run returned the controlled **mode: rules** fallback and a visible provider-unavailable notice. Catalog facts and source links were correct. No-match was honest; simulated API failures ended loading and displayed errors.
- Committed migrations match the tested database history. A second **db:deploy** preserved the new order and six products without seeding.

Quality changes and evidence

Fixed unsupported AI warranty/delivery claims by generating displayed answers from catalog rows while retaining AI selection of eligible products. Fixed centavo/single-digit budget parsing. Added two regression tests with saved failing and passing output. Restored the initial migration's historical directory name only after comparing the SQL checksum with the database record. Added **db:deploy**, environment-file exclusions and repeatable browser smoke tooling. Replaced the configured classroom password in public examples with a placeholder.

Compatible dependency updates and removal of unused backend Vitest resolved the recorded audit findings: final **npm audit** reported zero vulnerabilities at verification time. This is not a guarantee against future advisories.

Final **npm run check**: **PASS**, both lint checks, 8 frontend tests, 14 backend tests, production frontend build. Latest browser/API smoke: **11/11 PASS**, with 13 API response screenshots. See the API screenshot index. See test record, raw final check, browser results, screenshots and deployment plan.

Known limitations

- Authentication, roles, protected customer order history and administrator mutations are absent. Owner/other-customer authorization cases are not applicable. Local fictional-data demonstration only.
- Cart is stored in React memory and clears on reload. There is no real payment, reservation, or documented idempotency key; do not treat this as a production checkout or blindly resubmit an order after an uncertain network response.
- AI selects candidate products, but prose is catalog-authored to prevent unsupported claims. Matching is keyword-based; arbitrary policy/warranty/shipping questions are not supported. Provider availability depends on account/model configuration; fallback remains available.
- The first automated stock-page run timed out. API rejection and the detail page worked separately, and the complete run passed after a clean restart. Retained as a transient test failure, not evidence of a diagnosed application defect.
- Initial database had zero orders. The evidence refresh preserved earlier demo order #2 while adding #3, and both survived migration verification. Real customer or production order history was not exercised.
- No live staging or public deployment was completed. No instructor access URL exists. Gateway/access controls must be arranged before approved staging.

Evaluator startup (from repository root)

Follow the README for Node/PostgreSQL installation and database creation. Use Node 22 LTS or another supported version (minimum 20.19); the recorded checks used Node 24.21.0 and PostgreSQL 18.

```
# Copy only missing files; do not overwrite an existing local configuration.
if (-not (Test-Path backend/.env)) { Copy-Item backend/.env.example backend/.env }
if (-not (Test-Path frontend/.env)) { Copy-Item frontend/.env.example frontend/.env }
# Edit backend/.env: set your own DATABASE_URL password, PORT=3000,
# FRONTEND_URL=http://localhost:5173, optional Gemini key/model.
# Edit frontend/.env: VITE_API_URL=http://localhost:3000/api
npm ci
npm run db:generate
npm run db:deploy
# ONLY for a new empty disposable classroom database:
# npm run db:seed
npm run check
npm run dev
```

Open **http://localhost:5173** and **http://localhost:3000/api/health**. An existing populated database does not need seeding. Keep the dev terminal open. Use a second terminal for **npm run test:smoke**; it requires installed Microsoft Edge, default local ports 5173/3000, a free fallback API port 3001 and the sample catalog. For stable capture, run the API without file watching (**npm start --workspace backend**) and the frontend separately (**npm run dev --workspace frontend**). It creates **one fictional order** per successful run,

consumes one in-stock unit and overwrites final smoke evidence. Do not run it against a live or valuable database. For Chromium instead of Edge, install Playwright Chromium with **npx playwright install chromium** and set **$env:SMOKE_BROWSER_CHANNEL='chromium'**.

The refreshed evidence includes screenshots of the real API request/response data in a plain evidence viewer; raw JSON is retained alongside them. The saved smoke records are automated checks performed during assisted development. Paul Richard Calma should review the source, rerun the journey personally and explain the changes before submitting; this note does not claim unobserved manual work.

Individual contribution record

Student	Recorded test	Contribution	Issue to explain
Paul Richard Calma	Individual project owner; assisted automated checkout/stock/assistant checks retained in the test record; personally review and repeat before submission	Quality fixes, regression evidence, reproducible smoke runner, release and deployment documentation prepared in this working tree	Why a real product source does not substantiate invented warranty claims; catalog-authored answers enforce the boundary. Also explain safe migration deployment versus destructive reseeding.

Deployment status: local release candidate; local smoke passed on 12 November 2026. Private staging: not performed. Public deployment: not performed.
